

Web Site User Extension

The Web Site User extension provides tools for authenticating and authorizing Web site users and/or groups to access an InterLoom built Web application. Since many business processes require security, this extension is often the first step to increase functionality of the e-business system. The granular levels of security provided by the Web Site User extension also allow for varying degrees of secure content to be made available to users.

Business Case: As more business processes become Web-enabled, administering security becomes a critical issue for organizations that must decide who has access to differing levels of content and business functions within the e-business system. The increasing number of Web applications also requires that a single sign-on into the e-business system authenticate and appropriately authorize users to their respective applications. The Web Site User extension provides InterLoom™ Web objects, beans, and filters for Web site user to self-register, reset passwords, change their user properties, and login/logout. Users may be grouped for granular or hierarchical authorization.

Features	Benefits
LDAP compliant	Map current user directory to LDAP server to quickly register Web application users.
InterLoom Editor Control Web User Manager Web Permission Manager	Create and manage users and groups directly from the InterLoom Editor.
Web Admin Filter	Enable authorization to be toggled on/off.
